Sec No-9	Team No:19	Project Title-Subscription & Billing SaaS for Sports & Athletics
---------------------	-------------------	---

1. Abstract

Subscription & Billing SaaS for Sports & Athletics

The project aims to develop a Subscription and Billing SaaS system for sports and athletics organizations such as gyms, sports academies, fitness centers, and training clubs. The system will use MySQL to manage customer details, subscription plans, payments, invoices, and subscription validity.

Many sports and fitness organizations manage memberships and billing manually or using disconnected systems. This can lead to difficulties in tracking active and expired subscriptions, missed payments, incorrect billing records, and challenges in maintaining customer and payment information. Generating invoices and monitoring subscription renewals can also require significant time and effort. A centralized database system is needed to manage these activities efficiently and accurately.

The proposed SaaS solution provides a centralized MySQL database for managing customers, sports programs, subscription plans, subscriptions, payments, and invoices. Administrators can create and manage subscription plans, register customers, track subscription status, record payments, and generate billing information. The system can also identify upcoming expirations and pending payments, helping organizations manage renewals effectively. SQL queries, joins, constraints, views, and aggregate functions can be used to generate useful reports such as active subscriptions, monthly revenue, unpaid bills, and customer subscription history.

Overall, the system aims to reduce manual work, improve billing accuracy, and provide organized and reliable subscription management for sports and athletics businesses.

2. Team Details

Roll Number(s)	Name of the Student	Signature
2520030520	K.Mohith

3. Frameworks / Platforms / Software Used

MySQL – Database management and storage of customer, subscription, payment, and billing data.

MySQL Workbench – Database design, SQL query development, and database administration.

HTML5 & CSS3 – Designing the user interface.

JavaScript – Adding interactivity and client-side functionality.

Python – Backend logic and database connectivity, if required.

VS Code – Code development and project management.

Git & GitHub – Version control and project code management.
